

SIMPLEST FORM VALIDATION LIBRARY FOR FLUTTER

@dude.coder

Today You Will Learn Know
Simplest form validation
library for flutter

So let's do it

Save It First!

@dude.coder

SETUP

Add the **form_validator** package dependency in **pubspec.yaml**.

```
dependencies:  
  form_validator: ^1.0.2
```

IMPORT

Import the library.

```
import 'package:form_validator/  
form_validator.dart';
```

@dude.coder

EXAMPLE

```
TextFormField(  
  validator:ValidationBuilder()  
    .email().maxLength(50).build(),  
  decoration:  
    inputDecoration(labelText:'Email'),  
)
```

Now you can use ValidationBuilder class to create validation logic.

```
final validate = ValidationBuilder()  
  .minLength(10).maxLength(50).build();  
  
print(validate('test'));  
/// Minimun Length must be at least 10 characters  
  
print(validate('Hello World'));  
  
/// null, means value is correct
```

@dude.coder

LOCALIZATION

You can set global locale using `Validation Builder.setLocale(String Locale Name)` or you can also define locale on `validationBuilder({String LocaleName })` Constructor.

```
ValidationBuilder.setLocale('en');  
/// Will USE en Localization
```

```
ValidationBuilder()  
  .minLength(5)  
  .build();
```

```
// Will use az localization
```

```
validationBuilder(localeName:'az')  
  .minLength(5)  
  .build();
```

@dude.coder

ValidationBuilder is mutable.

you need to construct different instances for each validation.

Wrong

```
final builder = ValidationBuilder().email();  
TextFormField(  
Validator: builder.maxLength(50).build()),
```

Correct

```
final validator1 =  
ValidationBuilder().email().maxLength(50).build();  
TextFormField(Validator:validator1),
```
